## QUAD BILATERAL SWITCH

### ■ DESCRIPTION

The UTC **UCD4066** is a quad bilateral switch which can be applied for switching of analog signals and digital signals. When control input CONT is set to "H" level, the impedance between input and output of the switch becomes low and when it is set to "L" level, the impedance becomes high. It has a much lower "ON" resistance, and "ON" resistance is relatively constant over the input-signal range.

Notes: 1. AC Parameters are guaranteed by DC correlated testing.

2. These devices should not be connected to circuits with the power "ON".
3. In all cases, there is approximately 5 pF of probe and jig capacitance in the output; however, this capacitance is included in  $C_L$  wherever it is specified.
4.  $V_{IS}$  is the voltage at the in/out pin and  $V_{OS}$  is the voltage at the out/in pin.  $V_{CON}$  is the voltage at the control input.
5. Conditions for  $V_{IHC}$ :
  - a)  $V_{IS}=V_{DD}$ ,  $I_{OS}$ =standard B series  $I_{OH}$
  - b)  $V_{IS}=0\text{V}$ ,  $I_{OL}$ = standard B series  $I_{OL}$

## ■ SPECIAL CONSIDERATION

Using continuously under heavy loads may cause UTC **UCD4066** to decrease in the reliability even if the operating conditions are within the absolute maximum ratings and the operating ranges.

In applications where separate power sources are used to drive  $V_{DD}$  and the signal input, the  $V_{DD}$  current capability should exceed  $V_{DD}/R_L$ . This provision avoids any permanent current flow or clamp action of the  $V_{DD}$  supply when power is applied or removed from UTC **UCD4066**.
