

**U74LVC126A****CMOS IC****QUADRUPLE BUS BUFFER
GATES WITH 3-STATE
OUTPUTS****DESCRIPTION**

The **U74LVC126A** are quadruple bus buffer gates featuring independent line drivers with 3-state outputs. When OE is low, the nY outputs are in a high-impedance state. When OE is high, the device passes non-inverted data from the nA input to its nY output.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pull-down resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Inputs can be driven from either 3.3V to 5V devices. This feature allows the use of these devices as translators in a mixed 3.3V/5V system environment.

FEATURES

- * 1.65V to 3.6V V_{CC} Operation
- * Max t_{PD} of 4.7ns from A to Y at $V_{CC} = 3.3V$, $C_L = 50pF$, $R_L = 500\Omega$
- * $\pm 24mA$ output driver at 3V

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
