# Clock OSC

# SG7050EAN

Product name SG7050EAN 156.257812MHz KJGA Product Number / Ordering code X1G0042910115xx

Please refer to the 9.Packing information about xx (last 2 digits)

Output waveform LV-PECL Pb free / Complies with EU RoHS directive

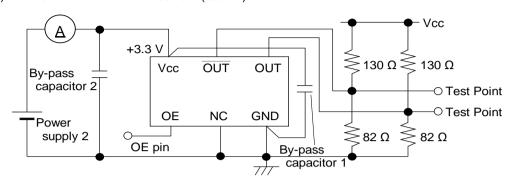

Reference weight Typ. 149 mg

1.Absolute maximum ratings							
Parameter	Symbol	Min.	Тур.	Max.	Unit	Conditions / Remarks	
Maximum supply voltage	Vcc-GND	-0.3	-	+4	V	-	
Storage temperature	T_stg	-40	-	+125	°C	Storage as single product	
Input voltage	Vin	-0.3	-	Vcc+0.3	V	ST or OE Terminal

#### 3.Test circuit

1) To observe waveform and current (case 1)

- \* The lines from OUT and OUT pin are same length.
- \* To measure the disable current, OE pin is connected to GND

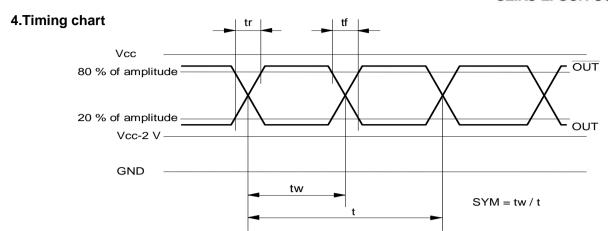

### 2) To observe waveform and current (case 2)

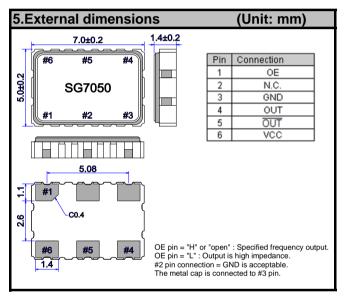

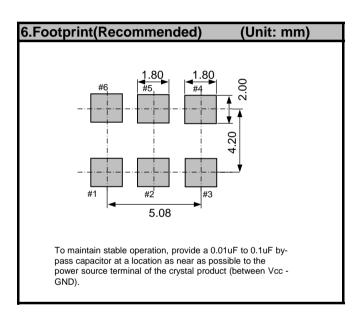

- \* The lines from OUT and OUT pin are same length.
- \* To measure the disable current, OE pin is connected to GND

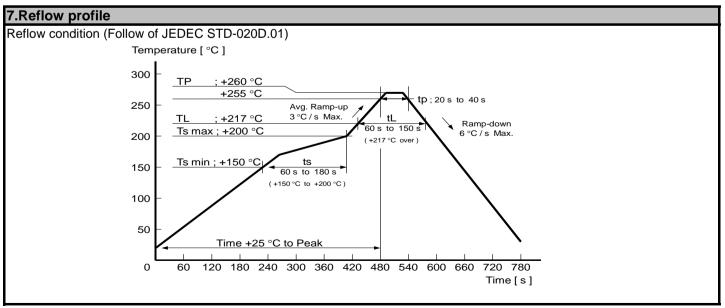

#### 3) Measurement condition

- A) Oscilloscope
- •Bandwidth should be 5 times higher than DUT's output frequency (4 GHz).
- •Probe ground should be placed closely from test point and lead length should be as short as possible.
- B) By-pass capacitor 1 (approx. 0.01 μF to 0.1 μF) places closely between Vcc and GND.
- C) By-pass capacitor 2 (approx. 10 µF) places closely between power supply terminals on the board.
- D) Use the current meter whose internal impedance value is small.
- E) Power supply
- Start up time (0 Vg90 %Vcc) of power source should be more than 150  $\mu$ s and slew rate should be less than 19.8 mV/ $\mu$ s.
- Impedance of power supply should be as low as possible.

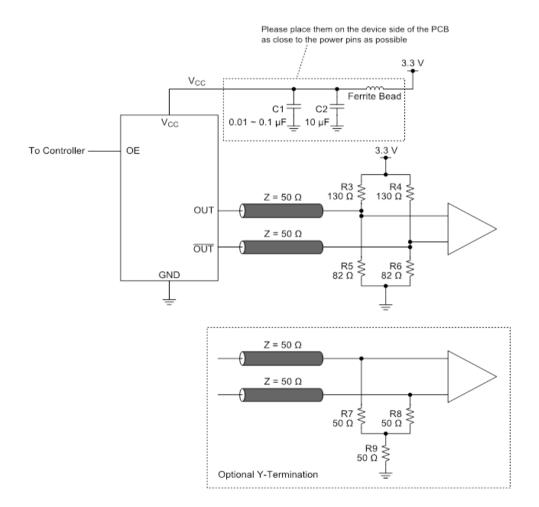

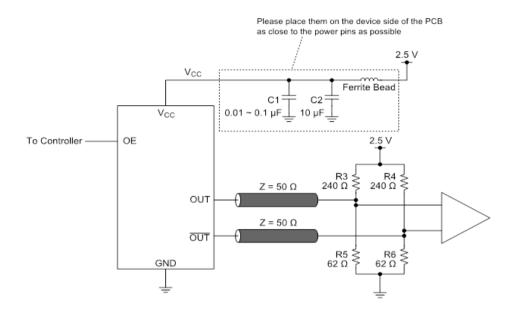

# 8.Example of schematic layout

This figure shows an example of this product's application schematic.

As with any high speed analog circuitry, the power supply pins for this device are vulnerable to noise. In order to achieve optimum jitter performance, power isolation with filter device is required for power supply pins.

In order to achieve best performance of the power isolation filter, it is recommended that the filter composing devices is placed on the device side of the PCB as close to the power pins as possible. The component value of this filter is just an example, it may have to be adjusted.

- \* By-pass capacitor (approx. 0.01 µF to 0.1 µF) places closely between Vcc and GND.
- \* By-pass capacitor (approx. 10 µF) places closely between power supply terminals on the board.
- \* Please design the two output lines by characteristic impedance 50  $\Omega$  and same length, and try to make the output lines as short as possible.
- \* Terminators place near the input device.
