3. Test circuit

1) To observe waveform and current (case 1)

* The lines from OUT and OUT pin are same length.

* To measure the disable current, OE pin is connected to GND

2) To observe waveform and current (case 2)

* The lines from OUT and OUT pin are same length.

3) Measurement condition

A) Oscilloscope

- Bandwidth should be 5 times higher than DUT's output frequency (4 GHz).
- Probe ground should be placed closely from test point and lead length should be as short as possible.

B) By-pass capacitor 1 (approx. 0.01 μ F to 0.1 μ F) places closely between Vcc and GND.

C) By-pass capacitor 2 (approx. 10 μ F) places closely between power supply terminals on the board.

D) Use the current meter whose internal impedance value is small.

E) Power supply

- Start up time (0 Vg90 %Vcc) of power source should be more than 150 μ s and slew rate should be less than 19.8 mV/ μ s.
- Impedance of power supply should be as low as possible.

8.PCB layout (2 layers, 2nd layer is all GND pattern)

SEIKO EPSON CORPORATION

- * By-pass capacitor (approx. 0.01 μ F to 0.1 μ F) places closely between Vcc and GND.
- * By-pass capacitor (approx. 10 μ F) places closely between power supply terminals on the board.
- * Please design the two output lines by characteristic impedance 100 Ω and same length, and try to make the output lines as short as possible.
